Assignment on estimating causal effects

- ➡ Define a data generating process to simulate data and a causal effect of interest.
- ➡ Implement **three** estimators of your choice to estimate the causal effect.
- ➡ Report their average error (compared against the ground truth) and standard deviation.
- ➡ Coding assignment that should be completed using the Python programming language.

Assignment on estimating causal effects

- **Due date: Monday, March 11, 23:59 (Montreal time)**
- 20% of your overall grade in the class.
  - Out of 100 points, you'll get full marks for turning in:
    - A **maximum 3** page report that clearly defines:
      - The data-generating process you used to simulate data;
      - The causal estimand you chose to study;
      - How it's identified and what it evaluates to in your simulated model;
      - The three estimators you implemented;
      - The results of estimation.
    - Your code as a ZIP file.
  - 15 points deducted if you didn't implement three functioning estimators.
  - 15 points deducted for incomplete report.
